0. Introduction

In this report, we will introduce the results of [S] and related results. We consider the following nonlinear Schrödinger equations:

$$\begin{aligned} -\Delta u + (1 + b(x))u &= f(u) \quad \text{in } \mathbf{R}^N, \\ u &\in H^1(\mathbf{R}^N). \end{aligned} \tag{*}$$

We mainly considered the one-dimensional case in [S] but, in this report, we consider not only one-dimensional case but also the high-dimensional case. Here, we assume that the potential $b(x) \in C(\mathbf{R}, \mathbf{R})$ satisfies the following assumptions:

- (b.1) $1 + b(x) \geq 0$ for all $x \in \mathbf{R}^N$.
- (b.2) $\lim_{|x| \rightarrow \infty} b(x) = 0$.
- (b.3) There exist $\beta_0 > 2$ and $C_0 > 0$ such that $b(x) \leq C_0 e^{-\beta_0|x|}$ for all $x \in \mathbf{R}^N$.

We also assume that the nonlinearity $f(u) \in C(\mathbf{R}, \mathbf{R})$ satisfies the following

- (f.0) $f(u) = |u|^{p-1}u$ for $p \in (1, \frac{N+2}{N-2})$ when $N \geq 3$ and $p \in (1, \infty)$ when $N = 2$.
- (f.1) There exists $\eta_0 > 0$ such that $\lim_{|u| \rightarrow 0} \frac{f(u)}{|u|^{1+\eta_0}} = 0$.
- (f.2) There exists $u_0 > 0$ such that

$$\begin{aligned} F(u) &< \frac{1}{2}u^2 \quad \text{for all } u \in (0, u_0), \\ F(u_0) &= \frac{1}{2}u_0^2, \quad f(u_0) > u_0. \end{aligned}$$

- (f.3) There exists $\mu_0 > 2$ such that $0 < \mu_0 F(u) \leq u f(u)$ for all $u \neq 0$.

To consider the (*), the following equation plays an important roles:

$$-\Delta u + u = f(u) \quad \text{in } \mathbf{R}^N, \quad u \in H^1(\mathbf{R}^N). \quad (0.1)$$

From (b.2), the equation $-\Delta u + u = f(u)$ appears as a limit when $|x|$ goes to ∞ in (*). To show the existence of positive solution of (*) in our arguments, the uniqueness (up to translation) of positive solutions of (0.1) is also important. Under the condition (f.0), it is well-known that the uniqueness (up to translation) of the positive solutions of (0.1). When $N = 1$, it is known that the conditions (f.1) and (f.2) are sufficient conditions for (0.1) to have an unique (up to translation) positive solution:

Remark 0.1. In Section 5 of [BeL1], Berestycki-Lions showed that if $f(u)$ is of locally Lipschitz continuous and $f(u) = 0$, then (f.2) is a necessary and sufficient condition for the existence of a non-trivial solution of (1.0). Moreover, it also was shown that the uniqueness (up to translation) of positive solutions under the (f.2). In Section 2 of [JT1], Jeanjean-Tanaka showed that when $f(u)$ is of continuous, (f.1) and (f.2) are sufficient conditions for (0.1) to have an unique positive solution.

The condition (f.3) is so called Ambrosetti-Rabinowitz condition, which guarantees the boundedness of (PS)-sequences for the functional corresponding to the equation (*) and (0.1). To state an our result for one-dimensional case, we also need the following assumption for $b(x)$.

(b.4) When $N = 1$, there exists $x_0 \in \mathbf{R}$ such that

$$\int_{-\infty}^{\infty} b(x - x_0) e^{2|x|} dx \in [-\infty, 2).$$

Our first theorem is the following.

Theorem 0.2. *When $N \geq 2$, we assume that (b.1)–(b.3) and (f.0) hold. Then (*) has at least a positive solution. When $N = 1$, we assume that (b.1)–(b.4) and (f.1)–(f.3) hold. Then (*) has at least a positive solution.*

In [S], we give a proof of Theorem 0.2 for the one-dimensional case. To prove the Theorem 0.2, we developed the arguments of [BaL] and [Sp]. We remark that, for high-dimensional case, the proof of Theorem 0.2 almost are parallel to the proof of [BaL]. However, for the proof of the one-dimensional case, we essentially developed the arguments of [BaL] and [Sp]. Bahri-Li [BaL] showed that there exists a positive solution of

$$-\Delta u + u = (1 - b(x))|u|^{p-1}u \quad \text{in } \mathbf{R}^N, \quad u \in H^1(\mathbf{R}^N), \quad (0.2)$$

where $N \geq 3$, $1 < p < \frac{N+2}{N-2}$ and $b(x) \in C(\mathbf{R}, \mathbf{R})$ satisfies (b.2)-(b.3) and

$$(b.1)' \quad 1 - b(x) \geq 0 \text{ for all } x \in \mathbf{R}^N.$$

For one dimensional case, Spradlin [Sp] proved that there exists a positive solution of the equation

$$-u'' + u = (1 - b(x))f(u) \quad \text{in } \mathbf{R}, \quad u \in H^1(\mathbf{R}). \quad (0.3)$$

They also assumed that $b(x) \in C(\mathbf{R}, \mathbf{R})$ satisfies (b.1)' and (b.2)-(b.3) and $f(u)$ satisfies (f.1)-(f.3) and

$$(f.4) \quad \frac{f(u)}{u} \text{ is an increasing function for all } u > 0.$$

When (f.0) or (f.4) holds, we can consider the Nehari manifold and they argued on Nehari manifold in [BaL] and [Sp]. In our situation, when $N = 1$, we can not argue on Nehari manifold. This was one of the difficulties which had to overcome in [S].

From the above results and Theorem 0.2, it seems that, when $N = 1$, Theorem 0.2 holds without condition (b.4). However (b.4) is an essential assumption for (*) to have non-trivial solutions. In what follows, we will show a result about the non-existence of nontrivial solutions for (*).

In next our result, we will assume that $N = 1$ and $b(x)$ satisfies the following condition:

$$(b.5) \quad \text{There exist } \mu > 0 \text{ and } m_2 \geq m_1 > 0 \text{ such that}$$

$$m_1 \mu e^{-\mu|x|} \leq b(x) \leq m_2 \mu e^{-\mu|x|} \quad \text{for all } x \in \mathbf{R}.$$

Here, we remark that, if (b.5) holds for $\mu > 2$, then $b(x)$ satisfies (b.1)-(b.3) and

$$\frac{2\mu}{\mu-2} m_1 \leq \int_{-\infty}^{\infty} b(x) e^{2|x|} dx \leq \frac{2\mu}{\mu-2} m_2.$$

Thus, when $m_2 < 1$ and μ is very large, the condition (b.4) also holds.

Our second result is the following:

Theorem 0.3. Assume $N = 1$, (b.5) holds and $f(u) = |u|^{p-1}u$ ($p > 1$).

- (i) If $m_1 > 1$, there exists $\mu_1 > 0$ such that (*) does not have non-trivial solution for all $\mu \geq \mu_1$.
- (ii) If $m_2 < 1$, there exists $\mu_2 > 0$ such that (*) has at least a non-trivial solution for all $\mu \geq \mu_2$.
- (iii) There exists $\mu_3 > 0$ such that (*) does not have sign-changing solutions for all $\mu \geq \mu_3$.

From Theorem 0.3, we see that Theorem 0.2 does not hold except for condition (b.4). This is a drastically different situation from the high-dimensional cases. This is one of the interesting points in our results.

We remark that the condition (b.4) implies $\int_{-\infty}^{\infty} b(x) dx < 2$ and the assumption of (ii) of Theorem 0.3 also means $\int_{-\infty}^{\infty} b(x) dx < 2$. Thus we expect that the difference from existence and non-existence of non-trivial solutions of (*) depends on the quantity of integrate of $b(x)$.

We can obtain this expectation from another viewpoint, which is a perturbation problem. Setting $b_{\mu}(x) = m\mu e^{-\mu|x|}$, $b_{\mu}(x)$ satisfies (b.5) and, when $\mu \rightarrow \infty$, $b_{\mu}(x)$ converges to the delta function $2m\delta_0$ in distribution sense. Thus (*) approaches to the equation

$$-u'' + (1 + 2m\delta_0)u = |u|^{p-1}u \quad \text{in } \mathbf{R}, \quad u \in H^1(\mathbf{R}), \quad (0.4)$$

in distribution sense. Here, if u is a solution of (0.4) in distribution sense, we can see that u is of C^2 -function in $\mathbf{R} \setminus \{0\}$ and continuous in \mathbf{R} and u satisfies

$$u'(+0) - u'(-0) = 2mu(0). \quad (0.5)$$

Moreover, since u is a homoclinic orbit of $-u'' + u = f(u)$ in $(-\infty, 0)$ or $(0, \infty)$, respectively, u satisfies

$$-\frac{1}{2}u'(x)^2 + \frac{1}{2}u(x)^2 - \frac{1}{p+1}|u(x)|^{p+1} = 0 \quad \text{for } x \neq 0. \quad (0.6)$$

When $x \rightarrow \pm 0$ in (0.6), from (f.1), we find

$$u'(-0) = -u'(+0), \quad |u'(\pm 0)| < |u(0)|. \quad (0.7)$$

Thus, from (0.5) and (0.7), it easily see that (0.4) has an unique positive solution when $|m| < 1$ and (0.4) has no non-trivial solutions when $|m| \geq 1$. Therefore we can regard Theorem 0.3 as results of a perturbation problem of (0.4).

To prove Theorem 0.3, we develop the shooting arguments which used in [BE]. Bianchi and Egnell [BE] argued about the existence and non-existence of radial solutions for

$$-\Delta u = K(|x|)|u|^{\frac{N+2}{N-2}}, \quad u > 0 \quad \text{in } \mathbf{R}^N, \quad u(x) = O(|x|^{2-N}) \quad \text{as } |x| \rightarrow \infty. \quad (0.8)$$

Here $N \geq 3$ and $K(|x|)$ is a radial continuous function. Roughly speaking their approach, by setting $u(r) = u(|x|)$, they reduce (0.8) to an ordinary differential equation and considered solutions of two initial value problems of that ordinary differential equation which have initial conditions $u(0) = \lambda$ and $\lim_{r \rightarrow \infty} r^{N-2}u(r) = \lambda$. And, examining whether those solutions have suitable matchings at $r = 1$, they argued about the existence and non-existence of radial solutions.

In [S], to prove Theorem 0.3, we also consider two initial value problems from $\pm\infty$, that is, for $\lambda_1, \lambda_2 > 0$, we consider the following two problems:

$$\begin{aligned} -u'' + (1 + b(x))u &= f(u), \\ \lim_{x \rightarrow -\infty} e^{-x}u(x) &= \lim_{x \rightarrow -\infty} e^{-x}u'(x) = \lambda_1, \end{aligned} \quad (0.9)$$

and

$$\begin{aligned} -u'' + (1 + b(x))u &= f(u), \\ \lim_{x \rightarrow \infty} e^x u(x) &= - \lim_{x \rightarrow \infty} e^x u'(x) = \lambda_2. \end{aligned} \quad (0.10)$$

Then (0.9) and (0.10) have a unique solution respectively and write those solutions as $u_1(x; \lambda_1)$ and $u_2(x; \lambda_2)$ respectively. We set

$$\begin{aligned} \Gamma_1 &= \{(u_1(0; \lambda_1), u_1'(0; \lambda_1)) \in \mathbf{R}^2 \mid \lambda_1 > 0\}, \\ \Gamma_2 &= \{(u_2(0; \lambda_2), u_2'(0; \lambda_2)) \in \mathbf{R}^2 \mid \lambda_2 > 0\}. \end{aligned}$$

Then, $\Gamma_1 \cap \Gamma_2 = \emptyset$ is equivalent to the non-existence of solutions for (*). Thus it is important to study shapes of Γ_1 and Γ_2 . In respect to the details of proofs of Theorem 0.3, see [S].

In next sections, we state about the outline of the proof of Theorem 0.2. We will consider the one-dimensional case in Section 1 and treat the high-dimensional case in Section 2.

1. The outline of the proof of Theorem 0.2 for $N = 1$

In this section, we consider the case $N = 1$. We will develop a variational approach which was used in [BaL] and [Sp].

In what follows, since we seek positive solutions of (*), without loss of generalities, we assume $f(u) = 0$ for $u < 0$. To prove Theorem 0.2, we seek non-trivial critical points of the functional

$$I(u) = \frac{1}{2} \|u\|_{H^1(\mathbf{R})}^2 + \frac{1}{2} \int_{-\infty}^{\infty} b(x)u^2 dx - \int_{-\infty}^{\infty} F(u) dx \in C^1(H^1(\mathbf{R}), \mathbf{R}),$$

whose critical points are positive solutions of (*). Here we use the following notations:

$$\begin{aligned} \|u\|_{H^1(\mathbf{R})}^2 &= \|u'\|_{L^2(\mathbf{R})}^2 + \|u\|_{L^2(\mathbf{R})}^2, \\ \|u\|_{L^p(\mathbf{R})}^p &= \int_{\mathbf{R}} |u|^p dx \quad \text{for } p > 1. \end{aligned}$$

From (f.1)–(f.2), we can see that $I(u)$ satisfies a mountain pass geometry (See Section 3 in [JT2].), that is, $I(u)$ satisfies

- (i) $I(0) = 0$.
- (ii) There exist $\delta > 0$ and $\rho > 0$ such that $I(u) \geq \delta$ for all $\|u\|_{H^1(\mathbf{R})} = \rho$.
- (iii) There exists $u_0 \in H^1(\mathbf{R})$ such that $I(u_0) < 0$ and $\|u_0\|_{H^1(\mathbf{R})} > \rho$.

From the mountain pass geometry (i)–(iii), we can define a standard minimax value $c > 0$ by

$$c = \inf_{\gamma \in \Gamma} \max_{t \in [0,1]} I(\gamma(t)), \quad (1.1)$$

$$\Gamma = \{\gamma(t) \in C([0,1], H^1(\mathbf{R})) \mid \gamma(0) = 0, I(\gamma(1)) < 0\}.$$

And, by a standard way, we can construct $(PS)_c$ -sequence $(u_n)_{n=1}^\infty$, that is, $(u_n)_{n=1}^\infty$ satisfies

$$\begin{aligned} I(u_n) &\rightarrow c & (n \rightarrow \infty), \\ I'(u_n) &\rightarrow 0 & \text{in } H^{-1}(\mathbf{R}) \quad (n \rightarrow \infty). \end{aligned}$$

Moreover, since $(u_n)_{n=1}^\infty$ is bounded in $H^1(\mathbf{R})$ from (f.3), $(u_n)_{n=1}^\infty$ has a subsequence $(u_{n_j})_{j=1}^\infty$ which weakly converges to some u_0 in $H^1(\mathbf{R})$. If $(u_{n_j})_{j=1}^\infty$ strongly converges to u_0 in $H^1(\mathbf{R})$, c is a non-trivial critical value of $I(u)$ and our proof is completed. However, since the embedding $L^p(\mathbf{R}) \subset H^1(\mathbf{R})$ ($p > 1$) is not compact, there may not exist a subsequence $(u_{n_j})_{j=1}^\infty$ which strongly converges in $H^1(\mathbf{R})$. Therefore, in our situation, we don't know c is a critical value.

In our situation, from the lack of the compactness mentioned the above, we must use the concentration-compactness approach as [BaL] and [Sp]. In the concentration-compactness approach, we examine in detail what happens in bounded (PS)-sequence. When we state the concentration-compactness argument for the (PS)-sequences of $I(u)$, the limit problem (0.1) plays an important role. Setting

$$I_0(u) = \frac{1}{2} \|u\|_{H^1(\mathbf{R})}^2 - \int_{-\infty}^{\infty} F(u) dx \in C^1(H^1(\mathbf{R}), \mathbf{R}),$$

the critical points of $I_0(u)$ correspond to the solutions of limit problem (0.1). The equation (0.1) has a unique positive solution, identifying ones which obtain by translations. Thus let $\omega(x)$ be a unique positive solution of (0.1) with $\max_{x \in \mathbf{R}} \omega(x) = \omega(0)$ and we set $c_0 = I_0(\omega)$. Since I_0 also satisfies the mountain pass geometry (i)–(iii), we see $c_0 > 0$ and c_0 is a unique non-trivial critical value.

For the bounded (PS)-sequences of $I(u)$, we have the following:

Proposition 1.1. *Suppose (b.1)–(b.2) and (f.1)–(f.2) hold. If $(u_n)_{n=1}^\infty$ is a bounded (PS)-sequence of $I(u)$, then there exist a subsequence $n_j \rightarrow \infty$, $k \in \mathbf{N} \cup \{0\}$, k -sequences*

$(x_j^1)_{j=1}^\infty, \dots, (x_j^k)_{j=1}^\infty \subset \mathbf{R}$, and a critical point u_0 of $I(u)$ such that

$$\begin{aligned} I(u_{n_j}) &\rightarrow I(u_0) + kc_0 \quad (j \rightarrow \infty), \\ \left\| u_{n_j}(x) - u_0(x) - \sum_{\ell=1}^k \omega(x - x_j^\ell) \right\|_{H^1(\mathbf{R})} &\rightarrow 0 \quad (j \rightarrow \infty), \\ |x_j^\ell - x_j^{\ell'}| &\rightarrow \infty \quad (j \rightarrow \infty) \quad (\ell \neq \ell'), \\ |x_j^\ell| &\rightarrow \infty \quad (j \rightarrow \infty) \quad (\ell = 1, 2, \dots, k). \end{aligned}$$

Proof. We can easily get Proposition 1.1 from Theorem 5.1 of [JT1]. Theorem 5.1 of [JT1] required the assumption $\lim_{u \rightarrow \infty} f(u)u^{-p} = 0$ ($p > 1$). However we take off that assumption for one dimensional case by improving Step 2 of Theorem 5.1 of [JT1]. In fact we have only to change $\sup_{z \in \mathbf{R}^N} \int_{B_1(z)} |v_n^1|^2 dx \rightarrow 0$ in Step2 to $\|v_n^1\|_{L^\infty(\mathbf{R})} \rightarrow 0$. ■

If the minimax value c satisfies $c \in (0, c_0)$, from Proposition 1.1, we see that $I(u)$ has at least a non-trivial critical point. In fact, let $(u_n)_{n=1}^\infty$ be a bounded $(PS)_c$ -sequence of $I(u)$, from Proposition 1.1, there exists a subsequence $n_j \rightarrow \infty$, $k \in \mathbf{N} \cup \{0\}$ and a critical point u_0 of $I(u)$ such that

$$I(u_{n_j}) \rightarrow I(u_0) + kc_0 \quad (j \rightarrow \infty).$$

Here, if $u_0 = 0$, we get $I(u_{n_j}) \rightarrow kc_0$ as $j \rightarrow \infty$. However this contradicts to the fact that $I(u_n) \rightarrow c \in (0, c_0)$ as $n \rightarrow \infty$. Thus $u_0 \neq 0$ and u_0 is a non-trivial critical point of $I(u)$. From the above argument, we have the following corollary.

Corollary 1.2. Suppose $I(u)$ has no non-trivial critical points and let $(u_n)_{n=1}^\infty$ be a (PS) -sequence of $I(u)$. Then, only kc_0 's ($k \in \mathbf{N} \cup \{0\}$) can be limit points of $\{I(u_n) \mid n \in \mathbf{N}\}$.

Remark 1.3. Corollary 1.2 essentially depends on the uniqueness of the positive solution of (0.1).

As mentioned the above, when $c \in (0, c_0)$, $I(u)$ has at least a non-trivial critical point. However, unfortunately, under the condition (b.1)–(b.4), it may be $c = c_0$. Thus we need consider another minimax value. To define another minimax value, we use a path $\gamma_0(t) \in C(\mathbf{R}, H^1(\mathbf{R}))$ which is defined as follows: for small $\epsilon_0 > 0$, we set

$$\begin{aligned} h(x) &= \begin{cases} \omega(x) & x \in [0, \infty], \\ x^4 + u_0 & x \in [-\epsilon_0, 0), \\ \epsilon_0^4 + u_0 & x \in (-\infty, -\epsilon_0), \end{cases} \\ \gamma_0(t)(x) &= \begin{cases} h(x - t) & x \geq 0, \\ h(-x - t) & x < 0. \end{cases} \end{aligned}$$

Here, we remark that u_0 was given in (f.2). This path $\gamma_0(t)$ was introduced in [JT2]. Choosing a proper $\epsilon_0 > 0$ sufficiently small, $\gamma_0(t)$ achieves the mountain pass value of $I_0(u)$ and satisfies the followings:

Lemma 1.4. *Suppose (f.1)–(f.2) hold. Then $\gamma_0(t)$ satisfies*

- (i) $\gamma_0(0)(x) = \omega(x)$.
- (ii) $I_0(\gamma_0(t)) < I_0(\omega) = c_0$ for all $t \neq 0$.
- (iii) $\lim_{t \rightarrow -\infty} \|\gamma_0(t)\|_{H^1(\mathbf{R})} = 0$, $\lim_{t \rightarrow \infty} \|\gamma_0(t)\|_{H^1(\mathbf{R})} = \infty$.

Proof. See Section 3 in [JT2].

Remark 1.5. When $f(u)/u$ is a increasing function, we can use a simpler path than $\gamma_0(t)$.

In fact, setting $\tilde{\gamma}_0(t) = t\omega : [0, \infty) \rightarrow H^1(\mathbf{R})$, we also have

- (i) $\tilde{\gamma}_0(1)(x) = \omega(x)$.
- (ii) $I_0(\tilde{\gamma}_0(t)) < I_0(\omega) = c_0$ for all $t \neq 1$.
- (iii) $\tilde{\gamma}_0(0) = 0$, $\lim_{t \rightarrow \infty} \|\tilde{\gamma}_0(t)\|_{H^1(\mathbf{R})} = \infty$.

Moreover, if $f(u)/u$ is a increasing function, in what follows, we can also construct a simpler proofs by aruging on Nehari manifold $N = \{u \in H^1(\mathbf{R}) \setminus \{0\} \mid I'(u)u = 0\}$. (See [Sp].)

Now, for $R > 0$, we consider a path $\gamma_R \in C(\mathbf{R}^2, H^1(\mathbf{R}))$ which is defined by

$$\gamma_R(s, t)(x) = \max\{\gamma_0(s)(x + R), \gamma_0(t)(x - R)\}.$$

In our proof of Theorem 0.2 in [S], the following proposition is a key proposition.

Proposition 1.6. *Suppose (b.1)–(b.3) and (f.1)–(f.2) hold. Then, for any $L > 0$, we have*

$$\lim_{R \rightarrow \infty} e^{2R} \left\{ \max_{(s,t) \in [-L, L]^2} I(\gamma_R(s, t)) - 2c_0 \right\} \leq \frac{\lambda_0^2}{2} \left(\int_{-\infty}^{\infty} b(x) e^{2|x|} dx - 2 \right). \quad (1.2)$$

Here $\lambda_0 = \lim_{x \rightarrow \pm\infty} \omega(x) e^{|x|}$.

Proof. See [S].

By using a translation, without loss of generalities, we assume $x_0 = 0$ in (b.4). If (b.4) with $x_0 = 0$ holds, from Proposition 1.6, for any $L > 0$, there exists $R_0 > 0$ such that

$$\max_{(s,t) \in [-L, L]^2} I(\gamma_{R_0}(s, t)) < 2c_0.$$

To prove the Theorem 0.2, we also need a map $m : H^1(\mathbf{R}) \setminus \{0\} \rightarrow \mathbf{R}$ which is defined by the following: for any $u \in H^1(\mathbf{R}) \setminus \{0\}$, a function

$$T_u(s) = \int_{-\infty}^{\infty} \tan^{-1}(x-s)|u(x)|^2 dx : \mathbf{R} \rightarrow \mathbf{R}$$

is strictly decreasing and $\lim_{s \rightarrow \infty} T_u(s) = -\|u\|_{L^2(\mathbf{R})}^2 < 0$ and $\lim_{s \rightarrow -\infty} T_u(s) = \|u\|_{L^2(\mathbf{R})}^2 > 0$. Thus, from the theorem of the intermediate value, $T_u(s)$ has an unique $s = m(u)$ such that $T_u(m(u)) = 0$. We also find that $m(u)$ is of continuous by the implicit function theorem to $(u, s) \mapsto T_u(s)$. The map $m(u)$ was introduced in [Sp]. We remark that $m(u)$ is regarded as a kind of center of mass of $|u(x)|^2$ and we can check the followings.

Lemma 1.7. *We have*

- (i) $m(\gamma_0(t)) = 0$ for all $t \in \mathbf{R}$.
- (ii) $m(\gamma_R(s, t)) > 0$ for all $-R < s < t < R$.
- (iii) $m(\gamma_R(s, t)) < 0$ for all $-R < t < s < R$.

Proof. Since $\gamma_0(t)(x)$ is a even function, we have (i). We Note that

$$\gamma_R(s, t)(x) = \begin{cases} \gamma_0(s)(x+R) & \text{for } x \in (-\infty, \frac{s-t}{2}], \\ \gamma_0(t)(x-R) & \text{for } x \in (\frac{s-t}{2}, \infty). \end{cases}$$

Since $\gamma_R(s, s)(x)$ is also a even function, we have

$$m(\gamma_R(s, s)) = 0 \quad \text{for all } s \in \mathbf{R},$$

and we get (ii)–(iii). ■

In what follows, we will complete the proof of Theorem 0.2 for $N = 1$.

Proof of Theorem 0.2 for $N = 1$. First of all, we defined a minimax value $c_1 > 0$ by

$$c_1 = \inf_{\gamma \in \Gamma_1} \max_{t \in [0, 1]} I(\gamma(t)),$$

$$\Gamma_1 = \{\gamma(t) \in C([0, 1], H^1(\mathbf{R})) \mid \gamma(0) = 0, I(\gamma(1)) < 0, |m(\gamma(t))| < 1\}.$$

Noting $\Gamma_1 \subset \Gamma$, we have

$$0 < c \leq c_1.$$

Since Γ_1 is not invariant by standard deformation flows of $I(u)$, c_1 may not be a critical point of $I(u)$. We will use c_1 to divide the case. We divide the case into the following three cases:

- (i) $c_1 < c_0$.

(ii) $c_1 = c_0$.

(iii) $c_1 > c_0$.

Proof of Theorem 0.2 for the case (i). Since the inequality $c_1 < c_0$ implies $0 < c < c_0$, from Corollary 1.2, we can see $I(u)$ has at least a non-trivial critical point. ■

Proof of Theorem 0.2 for the case (ii). In this case, if $c < c_1 = c_0$, then $I(u)$ has at least a non-trivial critical point from Corollary 1.2. Thus we may consider the case $c = c_1 = c_0$. In this case, for any $\epsilon > 0$, there exists $\gamma_\epsilon(t) \in \Gamma_1$ such that

$$c \leq \max_{t \in [0,1]} I(\gamma_\epsilon(t)) < c + \epsilon.$$

Since $\gamma_\epsilon \in \Gamma_1 \subset \Gamma$ and Γ is an invariant set by standard deformation flows of $I(u)$, by a standard Eklund principle, there exists $u_\epsilon \in H^1(\mathbf{R})$ such that

$$\begin{aligned} c &\leq I(u_\epsilon) \leq \max_{t \in [0,1]} I(\gamma_\epsilon(t)) < c + \epsilon, \\ \|I'(u_\epsilon)\| &< 2\sqrt{\epsilon}, \\ \inf_{t \in [0,1]} \|u_\epsilon - \gamma_\epsilon(t)\|_{H^1(\mathbf{R})} &< \epsilon. \end{aligned} \tag{1.3}$$

Then, from Proposition 1.1, there exist a subsequence $\epsilon_j \rightarrow 0$, $k \in \mathbf{N} \cup \{0\}$, k -sequences $(x_j^1)_{j=1}^\infty, \dots, (x_j^k)_{j=1}^\infty \subset \mathbf{R}$, and a critical point u_0 of $I(u)$ such that

$$\begin{aligned} I(u_{\epsilon_j}) &\rightarrow I(u_0) + kc_0 \quad (j \rightarrow \infty), \\ \left\| u_{\epsilon_j}(x) - u_0(x) - \sum_{\ell=1}^k \omega(x - x_j^\ell) \right\|_{H^1(\mathbf{R})} &\rightarrow 0 \quad (j \rightarrow \infty), \\ |x_j^\ell - x_j^{\ell'}| &\rightarrow \infty \quad (j \rightarrow \infty) \quad (\ell \neq \ell'), \\ |x_j^\ell| &\rightarrow \infty \quad (j \rightarrow \infty) \quad (\ell = 1, 2, \dots, k). \end{aligned} \tag{1.4}$$

Now, if $u_0 \neq 0$, our proof is completed. So we suppose $u_0 = 0$. Then, from (1.4), it must be $k = 1$. Thus, we have

$$\begin{aligned} \|u_{\epsilon_j}(x) - \omega(x - x_j^1)\|_{H^1(\mathbf{R})} &\rightarrow 0 \quad (j \rightarrow \infty), \\ |x_j^1| &\rightarrow \infty \quad (j \rightarrow \infty). \end{aligned} \tag{1.5}$$

On the other hand, we remark that, since $m(\omega) = 0$ and m is of continuous, there exists $\delta > 0$ such that

$$|m(u)| < 1 \quad \text{for all } u \in B_\delta(\omega) = \{v \in H^1(\mathbf{R}) \mid \|v - \omega\|_{H^1(\mathbf{R})} < \delta\}.$$

Thus, from (1.3) and (1.5), for some $\epsilon_0 \in (0, \frac{\delta}{2})$ and $t_0 \in [0, 1]$, we have

$$|m(\gamma_{\epsilon_0}(t_0)) - x_j^1| < 1.$$

This contradicts to $\gamma_{\epsilon_0} \in \Gamma_1$. Therefore $u_0 \neq 0$ and $I(u)$ has at least a non-trivial critical point. ■

Proof of the Theorem 0.2 for the case (iii). First of all, we set $\delta = \frac{c_1 - c_0}{2} > 0$ and choose $L_0 > 0$ such that

$$\max_{(s,t) \in D_{2L_0} \setminus D_{L_0}} I(\gamma_R(s, t)) < c_0 + \delta < c_1 \quad \text{for all } R > 3L_0. \quad (1.6)$$

Here we set $D_L = [L, L] \times [L, L] \subset \mathbf{R}^2$. Next, from Proposition 1.6, we can choose $R_0 > 3L_0$ such that

$$\max_{(s,t) \in D_{L_0}} I(\gamma_{R_0}(s, t)) < 2c_0. \quad (1.7)$$

Here we fix $\gamma_{R_0}(s, t)$ and define the following minimax value:

$$c_2 = \inf_{\gamma \in \Gamma_2} \max_{(s,t) \in D_{2L_0}} I(\gamma(s, t)),$$

$$\Gamma_2 = \{\gamma(s, t) \in C(D_{2L_0}, H^1(\mathbf{R})) \mid \gamma(s, t) = \gamma_{R_0}(s, t) \text{ for all } (s, t) \in D_{2L_0} \setminus D_{L_0}\}.$$

Then we have the following lemma.

Lemma 1.8. *We have*

$$0 < c_0 < c_1 \leq c_2 < 2c_0.$$

We postpone the proof of Lemma 1.8 to end of this section. If Lemma 1.8 is true, then Γ_2 is an invariant set by the deformation flows of $I(u)$. Thus $I(u)$ has a (PS)-sequence $(u_n)_{n=1}^\infty$ such that

$$I(u_n) \rightarrow c_2 \in (c_0, 2c_0) \quad (n \rightarrow \infty).$$

From Corollary 1.2, we can see that $I(u)$ must have at least a non-trivial critical point. Combining the proofs of the cases (i)–(iii), we complete a proof of Theorem 0.2. ■

Finally we show Lemma 1.8.

Proof of Lemma 1.8. The inequality $c_0 < c_1$ is an assumption of the case (iii). From $\gamma_{R_0} \in \Gamma_2$ and (1.6)–(1.7), $c_2 < 2c_0$ is obvious. Thus we show $c_1 \leq c_2$. For any $\gamma(s, t) \in \Gamma_2$, we have

$$m(\gamma(s, t)) > 0 \quad \text{for all } (s, t) \in D_1, \quad (1.8)$$

$$m(\gamma(s, t)) < 0 \quad \text{for all } (s, t) \in D_2. \quad (1.9)$$

Here we set $D_1 = \{(s, t) \in D_{2L_0} \setminus D_{L_0} \mid s < t\}$ and $D_2 = \{(s, t) \in D_{2L_0} \setminus D_{L_0} \mid s > t\}$. From (1.8)–(1.9), a set $\{(s, t) \in D_{2L_0} \mid |m(\gamma(s, t))| < 1\}$ have a connected component which contains a path joining two points $\gamma_{R_0}(-2L_0, -2L_0)$ and $\gamma_{R_0}(2L_0, 2L_0)$. Thus we construct a path $\gamma_1(t) \in \Gamma_1$ such that

$$\begin{aligned} \{\gamma_1(t) \mid t \in [1/3, 2/3]\} &\subset \{\gamma(s, t) \mid (s, t) \in D_{2L_0}\}, \\ \max_{t \in [0, 1/3] \cup [2/3, 1]} I(\gamma_1(t)) &\leq c_0. \end{aligned}$$

Thus we see

$$\begin{aligned} c_1 &\leq \max_{t \in [0, 1]} I(\gamma_1(t)) \\ &\leq \max_{(s, t) \in D_{2L_0}} I(\gamma(s, t)). \end{aligned} \tag{1.10}$$

Since $\gamma(s, t) \in \Gamma_2$ is arbitrary, from (1.10), we have

$$c_1 \leq c_2.$$

Thus we get Lemma 1.8. ■

Remark 1.9. In our proofs of Theorem 0.2, the path $\gamma_R(s, t)$ played an important role. In particular, the estimate (1.2) was an important. However, we don't know that $\gamma_R(s, t)$ is the best path to show the existence of positive solutions of (*). Using other path, we might be able to get better estimate than (1.2). Instead of $\gamma_R(s, t)$, we can consider another path $\tilde{\gamma}_R \in C(\mathbf{R}^2, H^1(\mathbf{R}))$ which is defined by

$$\tilde{\gamma}_R(s, t)(x) = \gamma_0(s)(x + R) + \gamma_0(t)(x - R).$$

We remark that $\tilde{\gamma}_R(s, t)$ is a natural path because we can regard $\tilde{\gamma}_R(s, t)$ as one-dimensional version of the path which was used in the proof of the high-dimensional case. (See Proposition 2.2.) Estimating $\tilde{\gamma}_R(s, t)$ by similar way to (1.2), for any $L > 0$, we have

$$\lim_{R \rightarrow \infty} e^{2R} \left\{ \max_{(s, t) \in [-L, L]^2} I(\tilde{\gamma}_R(s, t)) - 2c_0 \right\} \leq \frac{\lambda_0^2}{2} \left(\int_{-\infty}^{\infty} b(x)(e^{2x} + e^{-2x} + 2) dx - 4 \right).$$

We see that, if $\int_{-\infty}^{\infty} b(x)(e^{2x} + e^{-2x} + 2) dx < 4$ holds, then $\int_{-\infty}^{\infty} b(x)e^{2|x|} dx < 2$ also holds. Thus $\gamma_R(s, t)$ provides a better estimate than $\tilde{\gamma}_R(s, t)$.

2. The outline of the proof of Theorem 0.2 for $N \geq 2$

In this section, we consider the case $N \geq 2$. We remark that, when $N \geq 2$, our proofs almost are parallel to [BaL]. We assume $f(u) = u^p$ for $u \geq 0$ and $f(u) = 0$ for $u < 0$, where $p \in (1, \frac{N+2}{N-2})$ when $N \geq 3$, $p \in (1, \infty)$ when $N = 2$. We set

$$I(u) = \frac{1}{2} \|u\|_{H_b^1(\mathbf{R}^N)}^2 - \|u_+\|_{L^{p+1}(\mathbf{R}^N)}^{p+1} \in C^2(H^1(\mathbf{R}^N), \mathbf{R}),$$

where

$$\|u\|_{H_b^1(\mathbf{R}^N)}^2 = \|u\|_{H^1(\mathbf{R}^N)}^2 + \int_{\mathbf{R}^N} b(x) u^2 dx$$

By the standard ways, we reduce I_b to a functional

$$J(v) = \left(\frac{1}{2} - \frac{1}{p+1} \right) \left(\frac{\|v\|_{H_b^1(\mathbf{R}^N)}}{\|v_+\|_{L^{p+1}(\mathbf{R}^N)}} \right)^{\frac{2(p+1)}{p-1}}.$$

which is defined on

$$\Sigma = \{v \in H^1(\mathbf{R}^N) \mid \|v\|_{H^1(\mathbf{R}^N)} = 1, v_+ \neq 0\}.$$

Then $J \in C^1(\Sigma, \mathbf{R})$ and, for any critical point $v \in \Sigma$ of $J(v)$, $t_v v$ is a non-trivial critical point of $I(u)$ where $t_v = \|v\|_{H_b^1(\mathbf{R}^N)}^{\frac{2}{p-1}} \|v_+\|_{L^{p+1}(\mathbf{R}^N)}^{-\frac{p+1}{p-1}}$. Thus, in what follows, we seek non-trivial critical points of $J(v)$.

Let $\omega(x)$ be an unique radially symmetric positive solution of (0.1) for $f(u) = u^p$ and we set $c_0 = \frac{1}{2} \|\omega\|_{H^1(\mathbf{R}^N)}^2 - \frac{1}{p+1} \|\omega\|_{H^1(\mathbf{R}^N)}^{p+1} > 0$. For the (PS)-sequences of $J(u)$, we have the following:

Proposition 2.1. *Suppose (b.1)–(b.2), (f.0) hold and let $(v_n)_{n=1}^\infty$ be a (PS)-sequence of $J(u)$. Then there exist a subsequence $n_j \rightarrow \infty$, $k \in \mathbf{N} \cup \{0\}$, k -sequences $(x_j^1)_{j=1}^\infty, \dots, (x_j^k)_{j=1}^\infty \subset \mathbf{R}^N$, and a critical point u_0 of $I(u)$ such that*

$$J(v_{n_j}) \rightarrow I(u_0) + k c_0 \quad (j \rightarrow \infty),$$

$$v_{n_j}(x) - \frac{u_0(x) - \sum_{\ell=1}^k \omega(x - x_j^\ell)}{\left\| u_0(x) - \sum_{\ell=1}^k \omega(x - x_j^\ell) \right\|_{H^1(\mathbf{R}^N)}} \rightarrow 0 \quad \text{in } H^1(\mathbf{R}^N) \quad (j \rightarrow \infty),$$

$$|x_j^\ell - x_j^{\ell'}| \rightarrow \infty \quad (j \rightarrow \infty) \quad (\ell \neq \ell'),$$

$$|x_j^\ell| \rightarrow \infty \quad (j \rightarrow \infty) \quad (\ell = 1, 2, \dots, k).$$

Proof. Let $(v_n)_{n=1}^\infty$ be a (PS)-sequence of $J(v)$. Then $(t_{v_n} v_n)_{n=1}^\infty$ is a (PS)-sequence of $I(u)$. Moreover we remark that the set of the critical points of the functional $\frac{1}{2} \|u\|_{H^1(\mathbf{R}^N)}^2 - \frac{1}{p+1} \|u_+\|_{H^1(\mathbf{R}^N)}^{p+1} : H^1(\mathbf{R}^N) \rightarrow \mathbf{R}$ is written by $\{\omega(x+\xi) \mid \xi \in \mathbf{R}^N\} \cup \{0\}$ from the uniqueness of positive solutions of (1.0). Thus Proposition 2.1 easily follows applying Theorem 5.1 of [JT1] to $(t_{v_n} v_n)_{n=1}^\infty$. \blacksquare

By the similar arguments of Section 1, we have the following corollary.

Corollary 2.2. Suppose $I(u)$ has no non-trivial critical points and let $(v_n)_{n=1}^\infty$ be a (PS)-sequence of $J(v)$. Then, only kc_0 's ($k \in \mathbf{N}$) can be limit points of $\{J(v_n) \mid n \in \mathbf{N}\}$.

We set

$$c = \inf_{v \in \Sigma} J(v).$$

Then we can easily see that $0 < c \leq c_0$. From the boundedness of $J(v)$ from below, we get also more strong corollary.

Corollary 2.3. For any $b \in (-\infty, c_0) \cup (c_0, c_0 + c)$, $J(v)$ satisfies $(PS)_b$ -condition.

Proof. If $(PS)_b$ -condition does not hold for $b \in \mathbf{R}$, then for some $(PS)_b$ -sequence $(v_n)_{n=1}^\infty$, it must be $k \neq 0$ in Proposition 2.1. Thus we have

$$\lim_{n \rightarrow \infty} J(v_n) = b = kc_0 \quad \text{or} \quad \lim_{n \rightarrow \infty} J(v_n) = b \geq c + kc_0.$$

This implies Corollary 2.3. ■

When $c < c_0$, from Corollary 2.3, c is a critical value of $J(v)$. Thus this case is easy. Thus we consider the case $c = c_0$. When $c = c_0$, we must define another minimax value. To define another minimax value, the following proposition is important.

Proposition 2.4. Suppose $N \geq 2$, (b.1)–(b.3) and (f.0) hold. Then, there exists $R_0 > 0$ such that for any $R \geq R_0$, we have

$$\max_{(\zeta, \xi, t) \in \partial B_{\frac{1}{2}R} \times \partial B_R \times [0, 1]} J \left(\frac{t\omega(x - \zeta) + (1 - t)\omega(x - \xi)}{\|t\omega(x - \zeta) + (1 - t)\omega(x - \xi)\|_{H^1(\mathbf{R}^N)}} \right) < 2c_0. \quad (2.1)$$

Here $B_R = \{x \in \mathbf{R}^N \mid |x| \leq R\}$.

Proof. To get (2.1), for large $R > 0$, it sufficient to show

$$\max_{(\zeta, \xi, s, t) \in \partial B_{\frac{1}{2}R} \times \partial B_R \times \mathbf{R}^2} I(s\omega(x - \zeta) + t\omega(x - \xi)) < 2c_0. \quad (2.2)$$

In many papers [BaL], [A], [H1], [H2], the estimates like (2.2) were obtained. In [A], [H1], [H2], they treated more general $f(u)$ including u_+^p . Since we can get (2.2) by similar ways to those calculations, we omit the proof of (2.2). ■

Remark 2.5. When $N = 1$, the estimate (2.1) does not hold. (See Proposition 1.6 and [S].) We remark that, for some $C_0 > 0$, $\omega(x)$ satisfies

$$0 < \omega(x) \leq C_0 |x|^{-\frac{N-1}{2}} e^{-|x|} \quad \text{for all } x \in \mathbf{R}^N. \quad (2.3)$$

Roughly explaining about the difference from $N = 1$ and $N \geq 2$, when $N \geq 2$, we can obtain (2.1) by the effect of $|x|^{-\frac{N-1}{2}}$ in (2.3). On the other hand, when $N = 1$, since the effect of $|x|^{-\frac{N-1}{2}}$ vanishes, (2.1) does not hold.

To prove the Theorem 0.2, we also define a map $m : H^1(\mathbf{R}^N) \setminus \{0\} \rightarrow \mathbf{R}^N$ which is an expansion of m defined in Section 1. That is, for any $u \in H^1(\mathbf{R}^N) \setminus \{0\}$, we consider a map

$$T_u(\xi) = \left(\int_{\mathbf{R}^N} \tan^{-1}(x_1 - \xi_1) |u(x)|^2 dx, \dots, \int_{\mathbf{R}^N} \tan^{-1}(x_N - \xi_N) |u(x)|^2 dx \right) : \mathbf{R}^N \rightarrow \mathbf{R}^N.$$

Then we can see that $T_u(\xi)$ has an unique $\xi_u \in \mathbf{R}^N$ such that $T_u(\xi_u) = 0$ because

$$DT_u = \begin{bmatrix} \int_{\mathbf{R}^N} \frac{1}{1+(x_1-\xi_1)^2} |u(x)|^2 dx & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & \int_{\mathbf{R}^N} \frac{1}{1+(x_N-\xi_N)^2} |u(x)|^2 dx \end{bmatrix}.$$

Thus for any $u \in H^1(\mathbf{R}^N) \setminus \{0\}$, we define $m(u) = \xi_u$. We also find that $m(u)$ is of continuous by the implicit function theorem to $(u, \xi) \mapsto T_u(\xi)$. Since $\omega(x)$ is a radially symmetric function, from the definition of $m(u)$, we can easily see that

$$m(\omega(x - \xi)) = \xi \quad \text{for all } \xi \in \mathbf{R}^N. \quad (2.4)$$

In what follows, we will complete the proof of Theorem 0.2.

Proof of Theorem 0.2 for $N \geq 2$. We set

$$c = \inf_{v \in \Sigma} J(v).$$

When $c < c_0$, from Corollary 2.3, c is a critical point of $J(v)$ and our proof is completed. Thus we must consider the case $c = c_0$. For $a \in \mathbf{R}^N$ we defined a minimax value $c_a > 0$ by

$$c_a = \inf_{v \in \Sigma_a} J(v),$$

$$\Sigma_a = \{v \in \Sigma \mid m(v) = a\}.$$

Noting $\Sigma_a \subset \Sigma$ and $c = c_0$, we have

$$0 < c_0 \leq c_a.$$

We will show that $I(u)$ has at least a non-trivial critical point for the following both cases:

- (i) For some $a \in \mathbf{R}^N$, $c_0 = c_a$.
- (ii) For some $a \in \mathbf{R}^N$, $c_0 < c_a$.

Proof of Theorem 0.2 for the case (i). For any $\epsilon > 0$, there exists $\tilde{v}_\epsilon \in \Sigma_a$ such that

$$c_0 \leq J(\tilde{v}_\epsilon) < c_0 + \epsilon.$$

Since $\tilde{v}_\epsilon \in \Sigma_a \subset \Sigma$ and Σ is an invariant set by standard deformation flows of $J(v)$, by a standard Ekeland principle, there exists $v_\epsilon \in \Sigma$ such that

$$\begin{aligned} c_0 &\leq J(v_\epsilon) \leq J(\tilde{v}_\epsilon) < c_0 + \epsilon, \\ \|J'(v_\epsilon)\| &< 2\sqrt{\epsilon}, \\ \|v_\epsilon - \tilde{v}_\epsilon\|_{H^1(\mathbf{R})} &< \epsilon. \end{aligned} \tag{2.5}$$

Then, from Proposition 2.1, there exist a subsequence $\epsilon_j \rightarrow 0$, $k \in \mathbf{N} \cup \{0\}$, k -sequences $(x_j^1)_{j=1}^\infty, \dots, (x_j^k)_{j=1}^\infty \subset \mathbf{R}^N$, and a critical point u_0 of $I(u)$ such that

$$\begin{aligned} J(v_{\epsilon_j}) &\rightarrow I(u_0) + kc_0 \quad (j \rightarrow \infty), \\ v_{n_j}(x) - \frac{u_0(x) - \sum_{\ell=1}^k \omega(x - x_j^\ell)}{\left\| u_0(x) - \sum_{\ell=1}^k \omega(x - x_j^\ell) \right\|_{H^1(\mathbf{R}^N)}} &\rightarrow 0 \quad \text{in } H^1(\mathbf{R}^N) \quad (j \rightarrow \infty), \\ |x_j^\ell - x_j^{\ell'}| &\rightarrow \infty \quad (j \rightarrow \infty) \quad (\ell \neq \ell'), \\ |x_j^\ell| &\rightarrow \infty \quad (j \rightarrow \infty) \quad (\ell = 1, 2, \dots, k). \end{aligned} \tag{2.6}$$

Now, if $u_0 \neq 0$, our proof is completed. So we suppose $u_0 = 0$. Then, from (2.6), it must be $k = 1$. Thus, we have

$$\begin{aligned} \left\| v_{\epsilon_j}(x) - \frac{\omega(x - x_j^1)}{\|\omega\|_{H^1(\mathbf{R}^N)}} \right\|_{H^1(\mathbf{R}^N)} &\rightarrow 0 \quad (j \rightarrow \infty), \\ |x_j^1| &\rightarrow \infty \quad (j \rightarrow \infty). \end{aligned} \tag{2.7}$$

From (2.4), (2.5) and (2.7), we see that

$$|m(\tilde{v}_{\epsilon_j})| \rightarrow \infty \quad \text{as } j \rightarrow \infty.$$

This contradicts to $m(\tilde{v}_{\epsilon_j}) = a$. Therefore $u_0 \neq 0$ and $I(u)$ has at least a non-trivial critical point. ■

Proof of the Theorem 0.2 for the case (ii). From Proposition 2.4, we set $\zeta_0 = (\frac{1}{2}R_0, 0, \dots, 0)$ and $\delta = \frac{1}{2}(c_a - c_0) > 0$ and choose a large $R_0 > |a|$ such that

$$\max_{\xi \in \partial B_{R_0}} J(\omega(x - \xi)) < c_0 + \delta < c_a, \quad (2.8)$$

$$\max_{(\xi, t) \in \partial B_{R_0} \times [0, 1]} J\left(\frac{t\omega(x - \zeta_0) + (1 - t)\omega(x - \xi)}{\|t\omega(x - \zeta_0) + (1 - t)\omega(x - \xi)\|_{H^1(\mathbf{R}^N)}}\right) < 2c_0. \quad (2.9)$$

Here we define the following minimax value:

$$c_2 = \inf_{\gamma \in \Gamma} \max_{\xi \in B_{R_0}} J(\gamma(\xi)),$$

$$\Gamma = \left\{ \gamma(\xi) \in C(B_{R_0}, \Sigma) \mid \gamma(\xi)(x) = \frac{\omega(x + \xi)}{\|\omega\|_{H^1(\mathbf{R}^N)}} \text{ for all } \xi \in \partial B_{R_0} \right\}.$$

Then we have the following lemma.

Lemma 2.6. *We have*

$$0 < c_0 < c_a \leq c_2 < 2c_0.$$

We postpone the proof of Lemma 2.6 to end of this section. If Lemma 2.6 is true, then Γ is an invariant set by the deformation flows of $J(v)$. Thus $J(v)$ has a (PS)-sequence $(v_n)_{n=1}^\infty$ such that

$$J(v_n) \rightarrow c_2 \in (c_0, 2c_0) \quad (n \rightarrow \infty).$$

From Corollary 2.3, $J(u)$ satisfies $(PS)_{c_2}$ -conditions. Thus c_2 is a critical value of $J(v)$. That is, $I(u)$ has at least a non-trivial critical point. Combining the proofs of the cases (i)–(ii), we complete a proof of Theorem 0.2. \blacksquare

Finally we show Lemma 2.6.

Proof of Lemma 2.6. The inequality $c_0 < c_a$ is an assumption of the case (ii). From (2.9), $c_2 < 2c_0$ is obvious. Thus we show $c_a \leq c_2$. For any $\gamma \in \Gamma$, from (2.10), we have

$$m(\gamma(\xi)) = \xi \quad \text{for all } \xi \in \partial B_{R_0}.$$

Thus we can see

$$\deg(m \circ \gamma, B_{R_0}, a) = 1. \quad (2.10)$$

From (2.10), there exists $\xi_0 \in B_{R_0}$ such that $m(\gamma(\xi_0)) = a$. Therefore, since $\gamma(\xi_0) \in \Sigma_a$, we find that

$$\begin{aligned} c_a &\leq \inf_{v \in \Sigma_a} J(v) \\ &\leq J(\gamma(\xi_0)) \\ &\leq \max_{\xi \in B_{R_0}} I(\gamma(\xi)). \end{aligned} \quad (2.11)$$

Since $\gamma \in \Gamma$ is arbitrary, from (2.11), we have

$$c_a \leq c_2.$$

Thus we get Lemma 2.6. ■
